                                                             A computed retaining that the first the form the Enterococcus facealist genome. X12938 to X13919 represent these nucleotide sequences isolated from the Enterococcus facealist genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as configs. The computer-based system can identify fragments of the Enterococcus facealist genome with commercial importance. The products can be used to detect the presence of Enterococcus facealis in samples. They can also be used for diagnosing Enterococcual infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus facealis, or modulate related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus facealis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           19353 aattaaatgaagaaattcgtgctgcatttcctgaacaagatattttccgaattgaccatt 19412

the S.aureus DNA sequences allows putative functions to be assigned so industrial importance can be obtained. Specifically, sequences which are likely to encode antiqens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The S.aureus in a sample. S.aureus is implicated in numerous human diseases, skin and surgical wound infections, food poisoning, osteomypalitis, syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences homologues of any of the S.aureus is implicated in numerous toxic shock for recombinant production of the polypeptides. The new DNA sequences homologues of any of the S.aureus bDNA sequences for isolating

                                                                                          This sequence encodes Plasmodium falciparum glucose-6-phosphate dehydrogenase (GGPD). This sequence was isolated using the primers given in 038806-07. This sequence was used in the production of transformed E. coli which produce a recombinant P. falciparum G6PD. These transformed cells can be used in a method of screening drugs for activity against P. falciparum G6PD.
DNA segments encoding Plasmodium falciparum G6PD obtd. by PCR used to express proteins and raise antibodies for diagnosis and

includes a method for evaluating an agent for activity on the essential genes. Also included in the invention is the production of an antibacterial agent. The antibacterial agents of the invention are used to treat or prevent bacterial infections, particularly where caused by stabhylococcus aureus. The antibacterial agents are unlikely to be affected by known resistance mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                       1425 AAAGGATTTAAAACGCCTTGTTATCGAAAACCATTCGGTAGTGATTTAAAATCAGCCGAA 1366

the protein sequences. The invention also provides a DNA chip having arrayed on it at least 15 base pair fragment of any one or more of these DNA sequences. The DNA chip can be used methods for evaluating gene expression in S. pneumoniae and for identifying virulence genes in S. pneumoniae. Antibodies that selectively bind to the above proteins or peptide fragments can be used to treat S. pneumoniae infection. The antibodies can also be used to detect S. pneumoniae cells.
the above nucleic acids can be used for the recombinant expression of

Computer-readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, and pharmaceutical compositions and vaccines for Streptococcus pneumoniae

Claim 1; Page 869-876; 1409pp; English.

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V55524) recorded on it, or a representative fragment or a sequence at least 95% identical

(KIKK) KIKKOMAN CORP.

to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:11 to 391 (V52134 to V52524) are genomic fragments from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced
                                                                                                 by a process comprising: (a) screening a genomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mRNA, DNA or cDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the fragment of the S. pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the

transformant or a transductant containing a recombinant DNA in which the heat-resistant (thermostable) glucose-6-phosphate dehydrogenase gene is inserted to a vector DNA, can be cultured to produce the enzyme recombinantly. The method can prepare heat resistant glucose-6-phosphate dehydrogenase of high stability efficiently.
                                                                                                                                                                This DNA encodes a heat-resistant glucose-6-phosphate dehydrogenase. A
                                                                                                                                                                                                                                                                                                                                                                                                                             52 aagggatggaatcgcataatatttgagaagccatttggctttgatgcactttcttcccat 111

                                  X20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detections diseases related to Borrella infections in animals, and for the production of biosynthetic products such as enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New glucose-6-phosphate dehydrogenase gene from Bacillus species used for expressing stable, very pure enzyme, useful in assay of creatine kinase.

The protein produced, on culturing host cells transformed with a Vector contg. this sequence, is useful as a reagent for assaying creatine kinase. It has improved long term and thermal stability over known forms of the enzyme.

RESULT 12

T88030;

ŏ

```
The present sequence encodes the Brevibacterium flavum JM-233 glucose-6-phosphate dehydrogenase (G-6-PD). The G-6-PD can be recombinantly produced by transforming coryneform bacteria with the DNA molecule encoding it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Glucose-6-phosphate dehydrogenase - which can be recombinantly

X20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the production of blosynthetic products such as enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis

carbohydrate metabolism.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify H. Pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified

Leuconostoc dextranicum ATCC 19255. The enzymes may be mutated to increase stability, or to improve or modulate activity, pref. by deletion or substn. of 1 or more lyshe residues, or introduction of 1 or more cysteine residues. The mutant enzymes are prepd. by mutating the G6PDH gene and expression in host cells. They are used partic, to form conjugates for use in homogeneous immunoassays for analytes.

G6PDH genes (T30574-77) respectively code for the glucose-6-phosphate dehydrogenases (R95961-64) of Leuconostoc mesenteroides ATCC 12291. Leuconostoc citreum NCIMB 3351. Leuconostoc lactis NCDO 546 and Leuconostoc dextranicum ATCC 19255. The enzymes may be mutated to increase stability, or to improve or modulate activity, pref. by deletion or substn. of 1 or more lysine residues, or introduction of 1 or more cysteine residues. The mutant enzymes are prepd. by mutating the G6PDH gene and expression in host cells. They are used partic. to form conjugates for use in homogeneous immunoassays for analytes.

																																					No.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
